"These brilliant essays read as if Gleeson has made a vow to her readers to illuminate what it means to live in a human body—for better or for worse, for richer or poorer, in sickness and in health—all the days of her life. Come for the dark jokes and existential dread. Stay for the beauty and tenderness." —Jenny Offill, author of Weather "Nimbly written, balletic in style, heartfelt, spirited, and thoughtful, Sinéad Gleeson's Constellations is a powerful, inspiring gift to readers everywhere." —Jami Attenberg, author of All This Could Be Yours NAMED A BEST BOOK OF THE YEAR BY THE GUARDIAN \* OBSERVER \* IMAGE \* IRISH TIMES \* NEW STATESMAN \* IRISH INDEPENDENT A #1 Irish bestseller, Sinéad Gleeson's essays chronicle—in crystalline, tender, powerful prose—life in a body as it goes through sickness, health, motherhood, and love of all kinds. I have come to think of all the metal in my body as artificial stars, glistening beneath the skin, a constellation of old and new metal. A map, a tracing of connections and a guide to looking at things from different angles. We treat the body as an afterthought, until it no longer can be. Until the pain or the pleasure is too great. Sinéad Gleeson's life has been marked by terrible illness, including leukemia and debilitating arthritis. As a child, she bathed in the springs of Lourdes, ever hopeful that her body would cooperate, ever looking forward to the day when she could take her body for granted. But just as she turns inward to explore her own pain, and then the marvel of recovery, and then the arrival of her greatest joys—falling in love, becoming a mother—she turns her gaze outward. She delves into history, art, literature, and music, plotting the intimate experience of life in a women's body across a wide-ranging map. From Nick Cave to Taylor Swift, Botticelli to Frida Kahlo, Louisa May Alcott to Lucy Grealy, Constellations is an investigation into the different ways of seeing, both uniquely personal and universal in its resonances. In the tradition of some of our finest life writers, Gleeson explores—in her own spirited, generous voice—the fierceness of being alive. She has written "a book [that] every woman should read" (Eimear McBride).

Calling all stargazers, here is the book for you! Ancient people from many different cultures—Greek, Roman, Mezo-American, Arab—all looked up and imagined pictures in the sky by "drawing" a line from one star to another, like a connect-the-dots puzzle. These star pictures--constellations--represented myths and legends from the various cultures that still fascinate us today. Author of the tremendously popular Where Is Our Solar System? Stephanie Sabol relates many of the most popular constellation stories and explains what stars actually are: how they formed, why they die, and how they're grouped into constellation families.

This book compiles an array of interesting constellations that fell by the wayside before the IAU established the modern canon of constellations. That decision left out lesser known ones whose history is nevertheless interesting, but at last author John Barentine is giving them their due. This book is a companion to "The Lost Constellations", highlighting the more obscure configurations. The 16 constellations found in this volume fall into one or more of three broad categories: asterisms, such as the Big Dipper in Ursa Major; single-sourced constellations introduced on surviving charts by a cartographer perhaps currying the favor of sponsors; and re-brands, new figures meant to displace existing constellations, often for an ideological reason. All of them reveal something unique about the development of humanity's map of the sky.

Ptolemy's Almagest is one of the most influential scientific works in history. A masterpiece of technical exposition, it was the basic textbook of astronomy for more than a thousand years, and still is the main source for our knowledge of ancient astronomy. This translation, based on the standard Greek text of Heiberg, makes the work accessible to English readers in an intelligible and reliable form. It contains numerous corrections derived from medieval Arabic translations and extensive footnotes that take account of the great progress in understanding the work made in this century, due to the discovery of Babylonian records and other researches. It is designed to stand by itself as an interpretation of the original, but it will also be useful as an aid to reading the Greek text.

Large, double-page illustrations introduce stargazers of all ages to 22 major constellations, among them Aquarius, the water bearer; Orion, the hunter; Gemini, the twins; as well as Canis Major, Taurus, and Leo. Accompanying text relates mythological story behind each constellation's name and identifies its principal stars.
