The gender gap in science, technology, engineering and mathematics (STEM) varies greatly from country to country, and the number of Japanese women in these fields remains relatively few. This prompts us to ask why the proportion of female scientists in Japan is still remarkably low and what measures the government, universities and research institutes are taking to address this issue. This book sheds light on historical developments and the current gender equality situation in Japan, through the lens of women in STEM. It shows how a policy of gender equality in science and engineering has been introduced through the coordinated efforts of academia, scientific societies and the government, and how this has led to a slow but steady increase in female representation. The book draws on extensive data including interviews with government officials, scientists and educators in Japan to provide a revealing case study on how the underrepresentation of women in the fields of science, technology and engineering has been approached and dealt with by a national government. It heralds a new era for female scientists, by showcasing several programmes undertaken by government, universities and national research institutions to support multiple career paths for and the progression of female scientists in Japan. Tracing the historical development of Japan's policies towards women in science and education, this book will be welcomed by students and scholars interested in Japanese studies, comparative social policy, gender studies, employment and the history of science and technology.

In *Electron Microscopy Methods and Protocols*, well-practiced experts describe in detail the key electron microscopy techniques used for examining cells, tissue, biological macromolecules, molecular structure, and their interactions. With emphasis on cryotechniques for quantitative biological X-ray microanalysis, the book also includes those methods that use antibodies to locate proteins within cells and that prepare and analyze nucleic acids, proteins, and protein-nucleic acid complexes. Numerous immunogold labeling techniques for precise ultrastructural localization, distribution, and quantitation of macromolecules in cryo-fixed or chemically-fixed cells are described in sufficient detail to provide practical insight into their advantages and limitations. *Electron Microscopy Methods and Protocols* offers both newcomers and established researchers wanting to expand their repertoire of cutting-edge electron microscopy techniques—each optimized for reproducibility and robust results—today's gold-standard laboratory manual.
