For read operations, the data is sampled on the rising edge of the last clock cycle. For write operations, valid data appears on the bus before the end of the cycle, as shown in the timing diagram. While the timing diagram indicates that the data needs to be sampled on the rising clock, on most systems it remains valid for the entire clock cycle.

When this signal is active the system DMA controller has control of the address, data, and read/write signals. This signal should be included as part of ISA board select decodes to prevent incorrect board selects during DMA cycles. SD0 to SD15 System Data serves as the data bus bits for devices on the ISA bus. SD15 is the most significant bit.

Industry Standard Architecture (ISA) is the 16-bit internal bus of IBM PC/AT and similar computers based on the Intel 80286 and its immediate successors during the 1980s. The bus was (largely) backward compatible with the 8-bit bus of the 8088 -based IBM PC , including the IBM PC/XT as well as IBM PC compatibles .

The LPC bus was introduced by Intel in 1998 as a software-compatible substitute for the Industry Standard Architecture (ISA) bus. It resembles ISA to software, although physically it is quite different. The ISA bus has a 16-bit data bus and a 24-bit address bus that can be used for both 16-bit I/O port addresses and 24-bit memory addresses; both run at speeds up to 8.33 MHz.
