The basic induction motor has two main assemblies or components-a ROTOR and a STATOR, as shown in figure 6-1. The mechanical rotation of the rotor is produced through the principle of electromagnetic induction. Alternating current flows through the stator (a circular assembly of stationary coils or windings) which surrounds the rotor.

The rotor inserts into the stator and is secured to the plastering machine. The top part will suck the mixed material into the pump unit and exit it at the bottom, where it is sent along the material hose and out of the spray gun. The rotor and stator is a wearable part which need to be changed every so often.
