20/50 vision indicates that vision is reduced more than 50 percent from normal 20/20 or even 20/15. Importantly, in an eye with normal distance vision, near vision requires additional focusing called "accommodation." After age 40 to 50, additional optical assistance with reading glasses or bifocals is usually required for normal near vision.

Near Vision Near vision is measured using a small handheld chart that has paragraphs of text that is smallest at the top and largest at the bottom. These are of a standard size and 'normal' near vision is known as N6, with 'N' referring to near and the '6' referring to the size of the letters; N5 is better than N8, for example.

Vision Tests & Eye Charts | Retina Doctor Melbourne

The next feature to note on Jane's eye report is her near vision. Near visual acuity tests a person's central vision. It is usually tested by reading a hand-held card with diminishing print sizes. It tests the vision used for reading and 'near' tasks. N8 is newsprint. N12 is the common print size used in daily life

Visual Acuity Conversion Chart

Visual acuity (VA) commonly refers to the clarity of vision, but technically rates an examinee's ability to recognize small details with precision. Visual acuity is dependent on optical and neural factors, i.e., (1) the sharpness of the retinal image within the eye, (2) the health and functioning of the retina, and (3) the sensitivity of the interpretative faculty of the brain.

Visual acuity - Wikipedia

Fun Activities to Improve Visual Saccades - The OT Toolbox

Near visual acuity is a measurement of how well you can see close objects. Usually measured at about 16 inches, it is a good way to measure your ability to cope with tasks such as reading or sewing. In most cases, near visual acuity is measured with both eyes open.

Visual Acuity Testing or a Vision Exam

Visual acuity is defined as the finest detail that can be seen. It is a subjective clinical measurement which provides a baseline for understanding an individual's vision. It is tested at two distances, one where the eye is focusing (near vision) and the other, where the eye's focusing is relaxed (distance visual acuity).

Severity Indicators of Vision Impairment

If you are near sighted, then you have myopia which affects distance vision and is usually corrected with a concave lens being placed in front of the eye. If you are far sighted, then you have hyperopia which affects near vision which is commonly corrected with a convex lens being placed in front of the eye.
