Overall, current estimates are that one in 1,875 U.S. African American is affected with sickle cell anemia. Sickle cell anemia is caused by a point mutation in the  $\beta$  -globin chain of haemoglobin, causing the hydrophilic amino acid glutamic acid to be replaced with the hydrophobic amino acid valine at the sixth position.

Sickle Cell Anemia Case Study - UKEssays.com

A case study of the effects of mutation: Sickle cell anemia Sickle cell anemia is a genetic disease with severe symptoms, including pain and anemia. The disease is caused by a mutated version of the gene that helps make hemoglobin — a protein that carries oxygen in red blood cells. People with two copies of the sickle cell gene have the disease.

A case study of the effects of mutation: Sickle cell anemia

Abstract. In this case study on sickle cell anemia, students are introduced to some of the key researchers responsible for determining the molecular basis of the disease and learn about the functioning of erythrocytes as well as the notion that changes in the environment can influence the functioning of cells. Students also become familiar with the process of osmosis and how it can influence the sickling of the erythrocytes.

Sickle Cell Anemia - National Center for Case Study ...

Sickle cell anemia (SCA) is a mutation of the HBB gene that affects the development of normal hemoglobin, the major oxygen transporting protein in the body. SCA is an autosomal recessive genetic disorder which means that two copies of the abnormal gene have to be passed on from both parents in order for the disease to be active in the offspring.
