Network Basics: TCP/IP Protocol Suite TCP/IP, the protocol on which the Internet is built, is actually not a single protocol but rather an entire suite of related protocols. TCP is even older than Ethernet. It was first conceived in 1969 by the Department of Defense.

TCP/IP uses IP-addresses, which are 32-bit numbers. To make it easier to memorize such IP-addresses, they are usually expressed as 4 8-bit numbers (example: 192.168.10.1), where each of the 4 numbers is within the range of '0' to '255' (there are restriction on using '0' and '255', avoid using them.).

TCP/IP networks are the most common type of network today. With such a network, a number of computers or nodes can communicate with each other. An important aspect of this communication is routing: getting data packets from one node to another, in particular from one node on one network to another node on another network. Nodes, hubs and switches

See understanding the TCP/IP networking Model. Level 1 = physical e.g. media i.e. cable devices = Repeater. Level 2 = Data Link= Ethernet -devices are hubs,switches and bridges. Level 3= Network= IP protocol – devices are routers. A collision domain is the section of a network where packets can collide, and interfere with each other.

An IP address is a 32-bit number that uniquely identifies a host (computer or other device, such as a printer or router) on a TCP/IP network. IP addresses are normally expressed in dotted-decimal format, with four numbers separated by periods, such as 192.168.123.132.

TCP/IP History We're going to be talking about the history of TCP/IP. Now, back in 1969, the internet was actually a very small network that was developed at the request of the Advanced Research Projects Agency, or ARPA. And it was called the ARPANET at that point.

Internet Protocol (IP) version 4 (IPv4) is the current standard "IP" protocol used with TCP/IP — Transmission Control Protocol/Internet Protocol — which is the protocol for Internet addressing. Like the Open System Interconnection (OSI) model, TCP/IP has its own model. The OSI model and the TCP/IP models were both created independently.

Internet Protocol (IP) Addresses Because TCP/IP networks are interconnected across the world, each computer on the Internet must have a unique address (called an IP address) to make sure that transmitted data reaches the correct destination. Blocks of addresses are assigned to organizations by the Internet Assigned Numbers Authority (IANA).
