The Flower Botany

A flower having sepals, petals, stamens, and pistils is complete; lacking one or more of such structures, it is said to be incomplete. Stamens and pistils are not present together in all flowers. When both are present the flower is said to be perfect, or bisexual, regardless of a lack of any other part that renders it incomplete (see photograph).

Flowers we see in our lanes and meadows because of the uncouth look of their botanical names. We are uncertain as to how these barbarous words ought to be pronounced we know not what their so-called scientific names mean. The Greek or Latin names given to Wild Flowers are not, in themselves, in any way scientific. These words were those in common everyday use by the Greeks or Latins when the flower first happened to be named. If Chrysanthemum were scientific, so also would Goldilocks be. Both have practically the same meaning. Chrysanthemum is a compound Greek word, chrys

To Linneus, the great Swedish botanist, and founder of modern botany, belongs the honour and glory of having evolved a scientific plan for the naming of Wild Flowers. When Linneus lived born in 1707, died 1778 Latin was the universal language commonly used by writers of all countries. He therefore wrote in Latin, and gave to plants the Latin names by which they were known to the ancients. Linneus plan is as simple as it is efficient.

To every plant he gave two names, and no two plants have exactly the same two names. The first or group name corresponds to the surname of human beings. All plants botanically alike, or, so to say, belonging to one and the same household, is given a group name. This group name is peculiar to, and only given to the members of the same household. Some groups have many members, some only one. According to Bentham and Hookers British Flora 6th Ed., Wild Flowers are divided into 501 groups.
